23 rows × 23 columns

STORE 109 AND 86 HAS THE STRONGEST CORRELATION AT 0.643 NOW SHOWING IT TO GRAPH

```
In [74]: chips2_graph = pivot_chips2[[86, 109]]
chips2_graph.plot()
plt.show()
```

Checking correlation on entire table

```
In [75]: total_grp_pivot_table[86].sort_values(ascending=False).head(10)
```

```
Out[75]: STORE_NBR
31      1.000000
86      1.000000
193     0.933364
159     0.675773
231     0.674071
109     0.643075
132     0.629011
260     0.623775
61      0.617243
229     0.596886
Name: 86, dtype: float64
```

above are the top 10 correlations to store 86. Lets move further before amking a decision---

```
In [ ]: to see how the top 5 above correlations stack sales
```

```
In [76]: total_sorted.loc[[31,193,159,231,109]]
```

```
Out[76]: STORE_NBR
31      14.8
193     13.1
159    338.9
231  12996.0
109  10399.1
Name: TOT_SALES, dtype: float64
```

here store 31,159,193 sales are way too low to use.

```
In [80]: #grabing store 231 , 109, 86 from total group dataframe
```

```
three_amigos_86 = total_grp[[231,109,86]]
```

```
#MAKING DATAFRAME
```

```
amigos_86_df = pd.DataFrame(three_amigos_86)
```

```
In [81]: #Pivoting the Dataframe
```

```
amigos_86_pivot = amigos_86_df.pivot_table(index="MONTH_YEAR", columns="STORE_NBR",  
amigos_86_pivot.plot()  
plt.show()
```

now as you can see store 231 even though has a good correlation store 109 is a much better fit. Store 31 even though is a best match correlation wise it does not make any sense with sales volume so we will go with store "41".

For trial store 86 i will use store number 109 as a control store

```
In [82]: #Looking for control store for store 88
```

```
total_grp_pivot_table[88].sort_values(ascending=False).head(10)
```

```
Out[82]: STORE_NBR
206      1.000000
88       1.000000
159      0.862608
193      0.836296
201      0.737583
188      0.733516
229      0.707309
228      0.697039
61       0.686658
140      0.613791
Name: 88, dtype: float64
```

above are the top 10 correlations to store 88 . so, lets move further to make any decision

```
In [83]: # grabbing the total sales sorted series to see how the sales stack up for the top
total_sorted.loc[[206,88,159,193,201,188,229,228,61,140]]
```

```
Out[83]: STORE_NBR
206      7.60
88     16333.25
159      338.90
193      13.10
201     14298.70
188      3086.00
229     10417.90
228      4236.30
61       562.90
140      244.90
Name: TOT_SALES, dtype: float64
```

STORE 206,159,188,228,61,140, 7 193 SALES ARE WAY TOO LOW TO USE

```
In [84]: #grabing store 201 , 229, 88 from total group dataframe

three_amigos_88 = total_grp[[201 , 229, 88]]

#MAKING DATAFRAME
amigos_88_df = pd.DataFrame(three_amigos_88)
```

```
In [85]: #Pivoting the Dataframe
amigos_88_pivot = amigos_88_df.pivot_table(index="MONTH_YEAR", columns="STORE_NBR",
amigos_88_pivot.plot()
plt.show()
```

SO STORE 201 CLOSE TO THE PATTERN OF STORE 88

```
In [87]: sorted_88 = total_grp_pivot_table[88].sort_values(ascending=False)
sorted_88[201]
```

```
Out[87]: np.float64(0.7375831241350634)
```

NOW store 229 even though has a good correlations but store 201 is much suitable. store 206 even though is a best match correlationswise. it does not make any sense with sales volume . so we will go with store 201.

for trial store 88 i will use store number 201 as a control store its a 0.737 correlation.

```
In [ ]: #creating new dataframe for trial and control store
```

```
In [ ]: #selecting trial and control store from chips_trial
```

```
In [93]: trial_store_77 = dataset.loc[dataset["STORE_NBR"] == 77]
control_store_41 = dataset.loc[dataset["STORE_NBR"] == 41]

trial_store_86 = dataset.loc[dataset["STORE_NBR"] == 86]
control_store_109 = dataset.loc[dataset["STORE_NBR"] == 109]

trial_store_88 = dataset.loc[dataset["STORE_NBR"] == 88]
control_store_201 = dataset.loc[dataset["STORE_NBR"] == 201]

trial_store_77
```

In [132]: #grouping stores by month
grouped88 = trial_store_88.groupby("MONTH_YEAR")
grouped201 = control_store_201.groupby("MONTH_YEAR")
```

```
In [133]: grouped201["TOT_SALES"].sum().plot(label="Control store 201")
grouped88["TOT_SALES"].sum().plot(label="Trial store 88")
plt.ylabel("Sales")
plt.legend()
plt.title("Sales during trial period ")
plt.show()
```

now consequitively for the 3rd pair we can see a clear difference between the trial store and the control store lets look at the next pair of stores

In [ ]: LETS VISUALIZE THE PRODUCT QUANTITY SOLD

```
In [134]: grouped41["PROD_QTY"].sum().plot(label="Control store 41")
grouped77["PROD_QTY"].sum().plot(label="Trial store 77")
plt.ylabel("PROD_QTY")
plt.legend()
plt.title("Product Quantity during trial period ")
plt.show()
```

```
In [135]: grouped109["PROD_QTY"].sum().plot(label="Control store 109")
grouped86["PROD_QTY"].sum().plot(label="Trial store 86")
plt.ylabel("PROD_QTY")
plt.legend()
plt.title("Product Quantity during trial period ")
plt.show()
```

```
In [136]: grouped201["PROD_QTY"].sum().plot(label="Control store 201")
grouped88["PROD_QTY"].sum().plot(label="Trial store 88")
plt.ylabel("PROD_QTY")
plt.legend()
plt.title("Product Quantity during trial period ")
plt.show()
```

In [ ]: AS WE CAN SEE BY THE GRAPHS ABOVE THE TRIALS STORE OUTPERFORMED THE CONTROL STORES

In [ ]: LETS SEE HOW THEY STACK UP WITH AVERAGE TRANSACTION PER CUSTOMER

In [137]: `grouped77["LYLTY_CARD_NBR"].value_counts().mean()`

Out[137]: `np.float64(1.048417132216015)`

In [143]: `grouped201["LYLTY_CARD_NBR"].value_counts().mean()`

Out[143]: `np.float64(1.1689045936395759)`

In [149]: `group1 = ["Trial 77", "Control 41"]`  
`group2 = ["Trial 86", "Control 109"]`

```

group3 = ["Trial 88", "Control 201"]
values_grp_1 = [1.048417132216015, 1.05]
values_grp_2 = [1.2544861337683524, 1.2918454935622317]
values_grp_3 = [1.2363036303630364, 1.1689045936395759]

plt.bar(group1, values_grp_1, label = group1, color = "blue")
plt.bar(group2, values_grp_2, label = group3, color = "darkred")
plt.bar(group3, values_grp_3, label = group1, color = "purple")

plt.ylabel("PROD_QTY")
plt.legend(loc = "upper right", bbox_to_anchor= (1.3, 1))
plt.title("Average products per customer Trial Period")
plt.show()

```

THE NEW STORE LAYOUT SEEMS TO BE WORKING WELL. SALES, PRODUCTS SOLD, REPEAT CUSTOMERS, AND AVERAGE TRANSACTIONS PER CUSTOMER HAVE ALL GONE UP. THIS SHOWS THAT TRIAL STORES ARE DOING BETTER THAN CONTROL STORES.

MY RECOMMENDATION IS TO ADD MORE TRIAL STORES AND CHECK THE PERFORMANCE AGAIN IN 3 MONTHS TO SEE IF THE SALES STAY HIGH AND STABLE.
